

3. What surprised me in my finding is that the median computer science jobs median is not that much substantially higher than the other jobs I was looking at.

4. I ranked the jobs based on my interests and the potential for career change. I placed project management and data science very high on my list because I hope to work in an office environment with a team. Additionally, I believe that general statistical and computing skills will help me secure an entry-level position without necessarily needing a master's degree, although I am open to pursuing one if necessary. On the other hand, I ranked occupational therapy at the bottom because of its limited availability and the requirement for a master's degree for entry-level positions, which demands a significant commitment.
